- Enrico del Grosso

Outline

- Project overview
- Workflow
- VO management
- Clients
- Summary and outlook

Technical project vision

- Support for workflow-centric, complex applications
- Data and knowledge management
- Targeting a wide range of end-users with widely varying IT and Grid expertise
- Easy to use, install, configure, administrate
- Generic system, applicable in a wide range of application domains

Scenario: REACH

„Registration, Evaluation, and Authorization of CHemicals“

EC Legislation, valid from June 2007

30000 substances (volume > 1 ton/year) have to be comprehensively tested for possible risks to human health and the environment,

resulting in....

Cost: 3.5 billion Euro + 3.9 million lab animals

E.Benfenati, M. Casalegno (Inst. Mario Negri)

„In silico“ methods for REACH

Can this cost be reduced?

YES.

The use of „in silico“ methods such as **QSAR**, could save 1.3-1.9 million lab animals

E.Benfenati, M. Casalegno (Inst. Mario Negri)

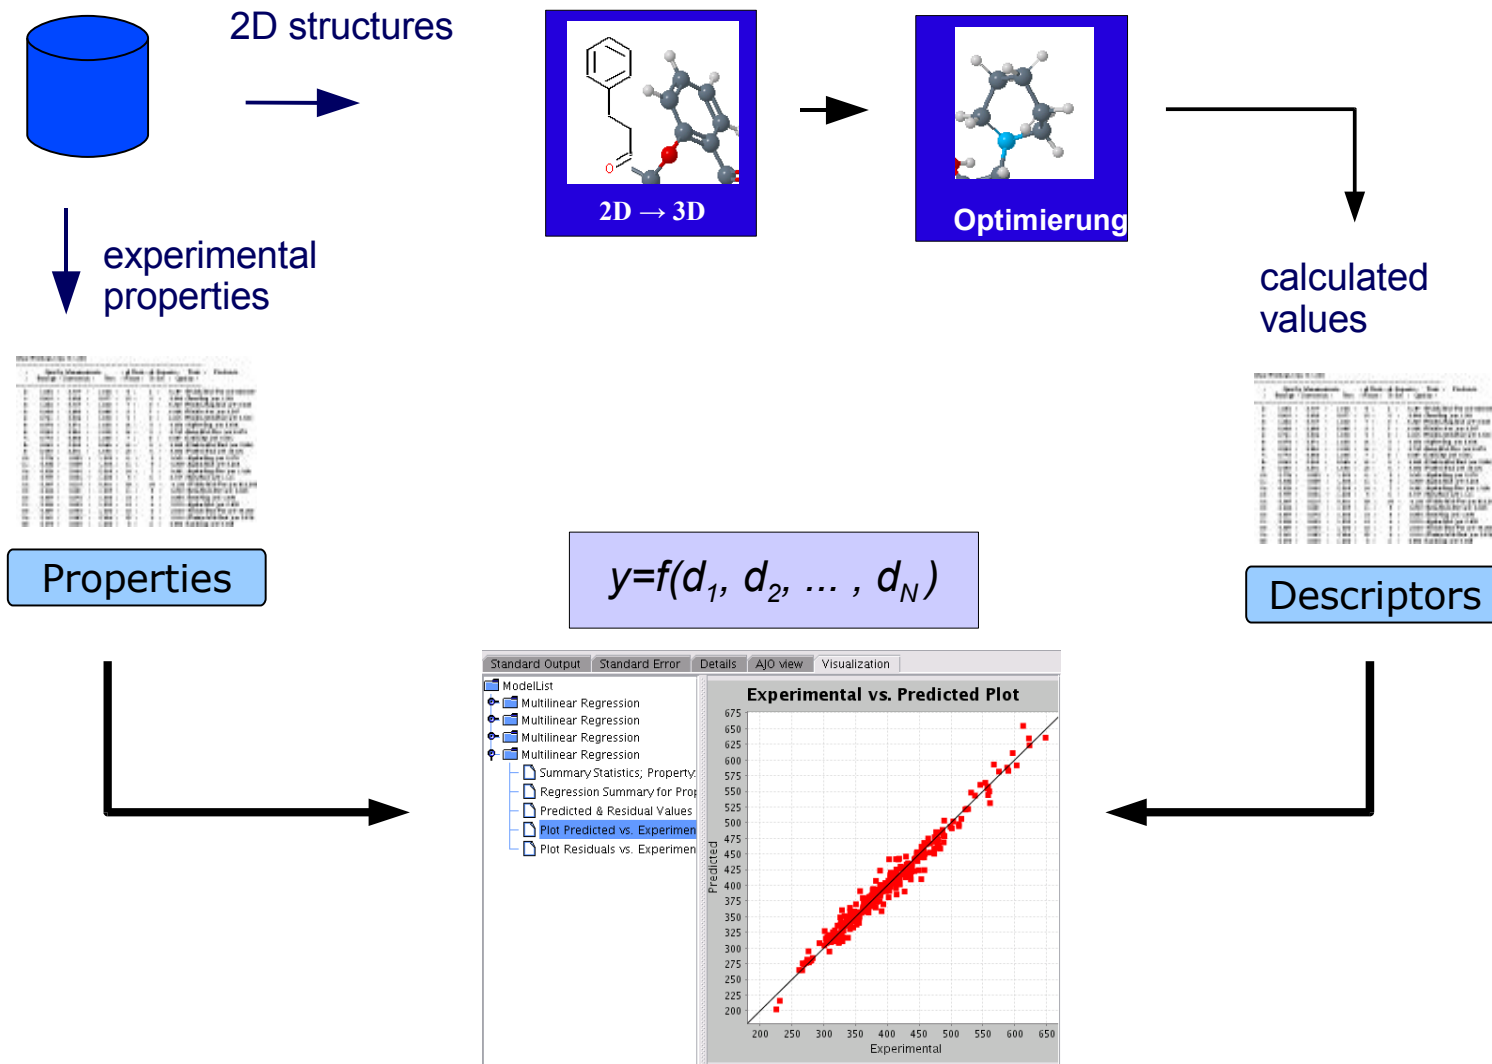

Quantitative Structure-Activity Relationship

- establish *statistical correlations* between *structural descriptors* and *experimental properties* of chemical substances

Name	Type	Value

QSAR: workflow

QSAR for risk assessment

QSAR could be used in the frame of REACH ...

Challenges of the available QSAR tools, e.g.

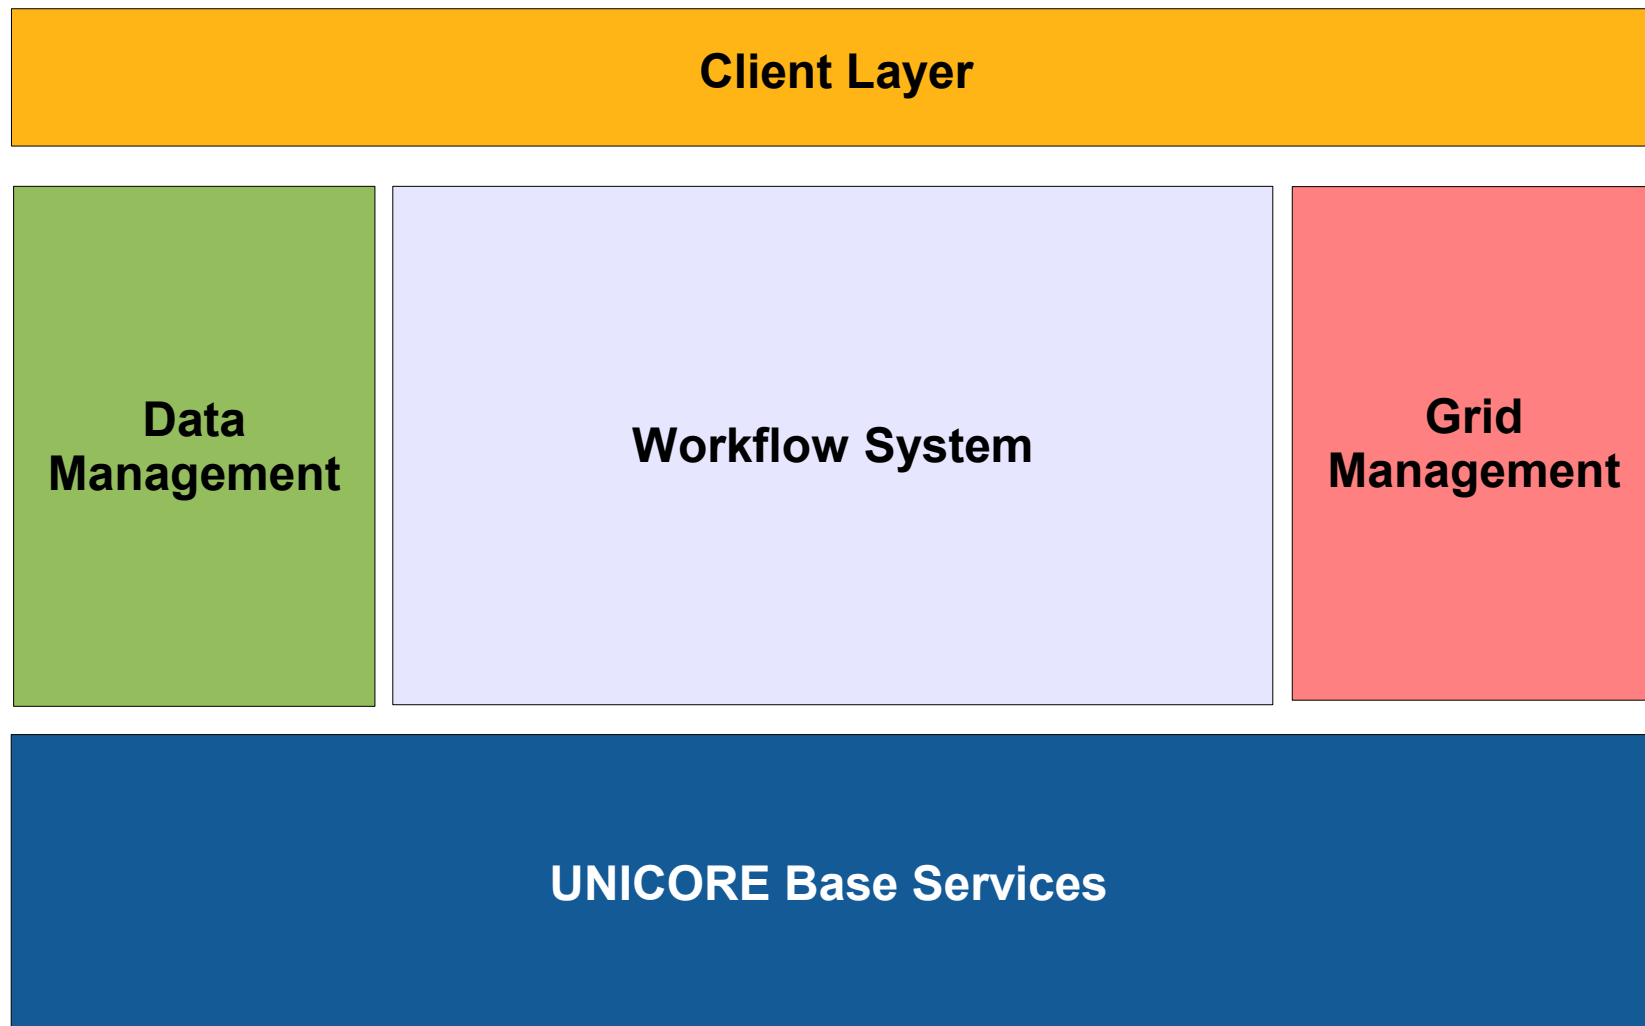

- | | |
|----------------------|---------------------------------------|
| - Reproducibility: | Different users, different results? |
| - Scalability: | Deal with large data sets |
| - Automation: | Currently workflow is user-controlled |
| - Standardisation: | No generally accepted procedures |
| - User friendliness: | Expert knowledge needed |
| - Provenance: | How exactly was the model produced? |

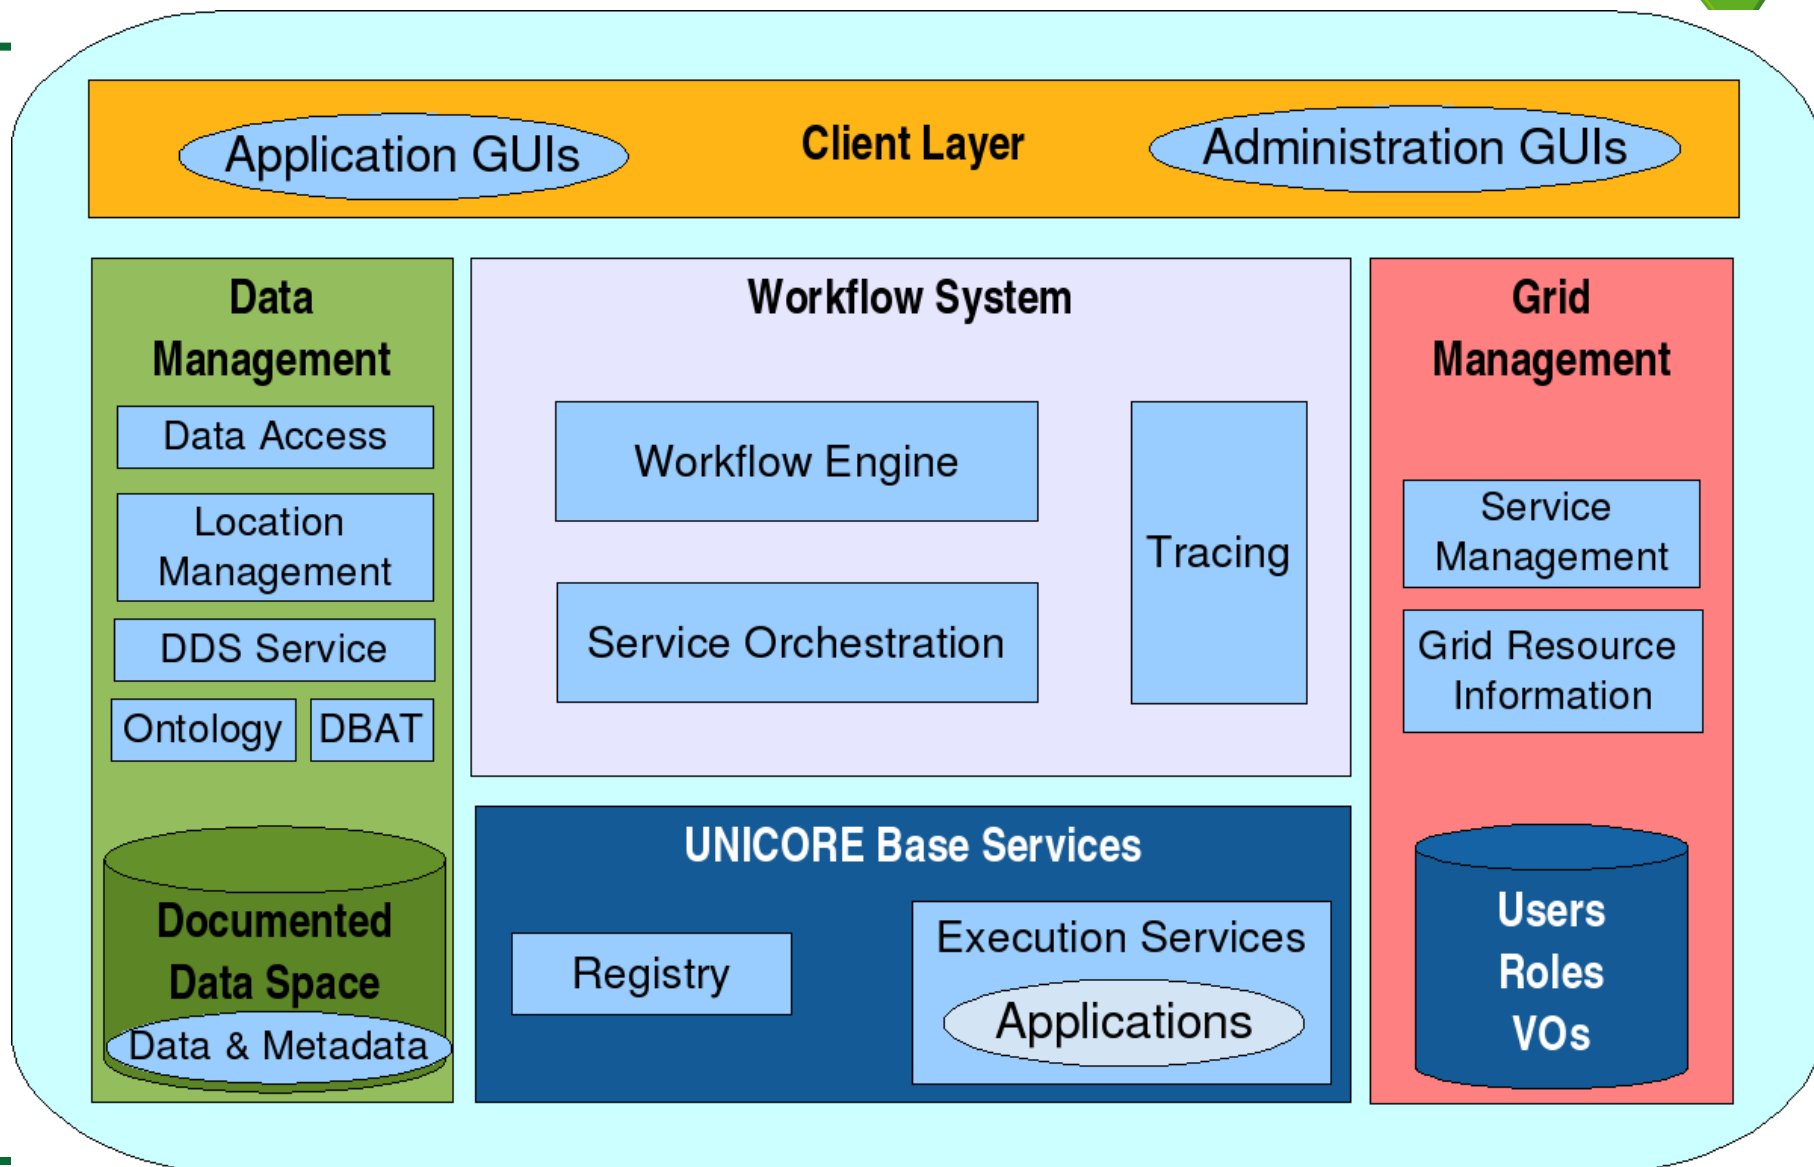

Chemomomentum offers solutions to these challenges!

E.Benfenati, M. Casalegno (Inst. Mario Negri)

Architecture: the big picture

Architecture: detailed view

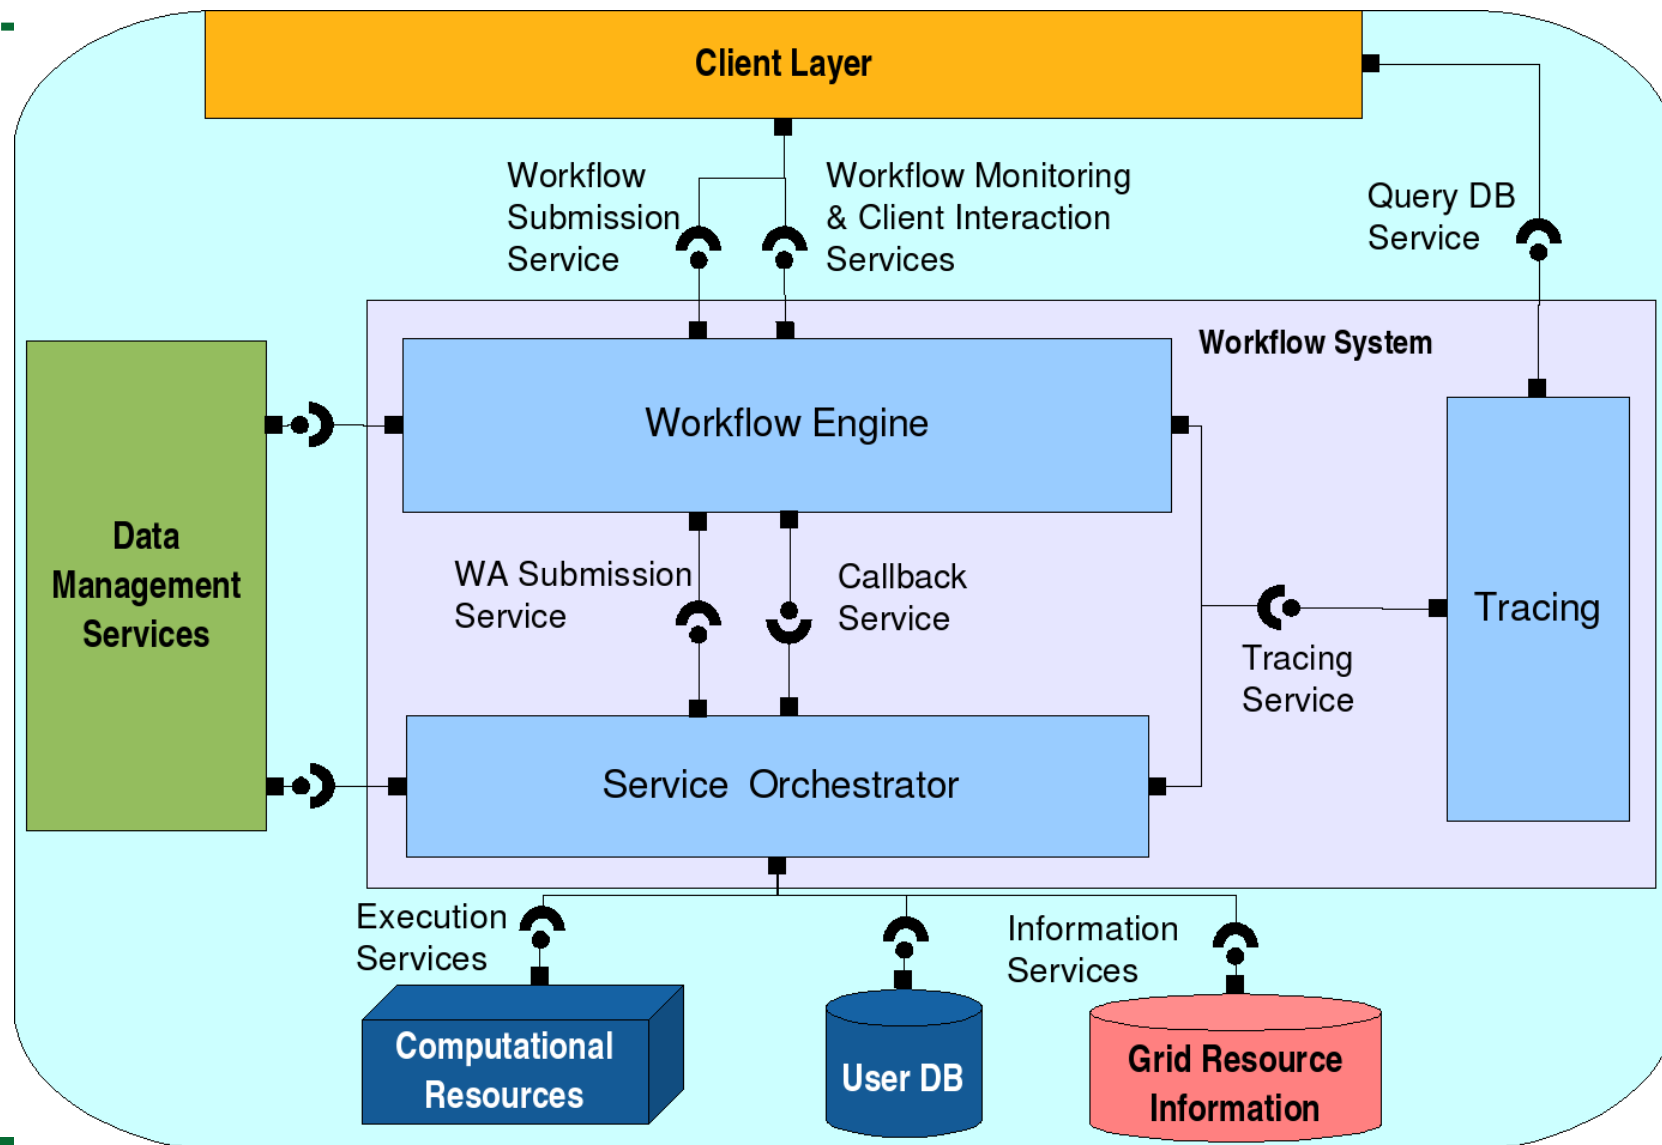

Some highlights ...

- Workflows
 - Workflow system architecture
 - Service orchestrator and brokering
- VO management service
- Chemomomentum client layer

Workflow system: architectural goals

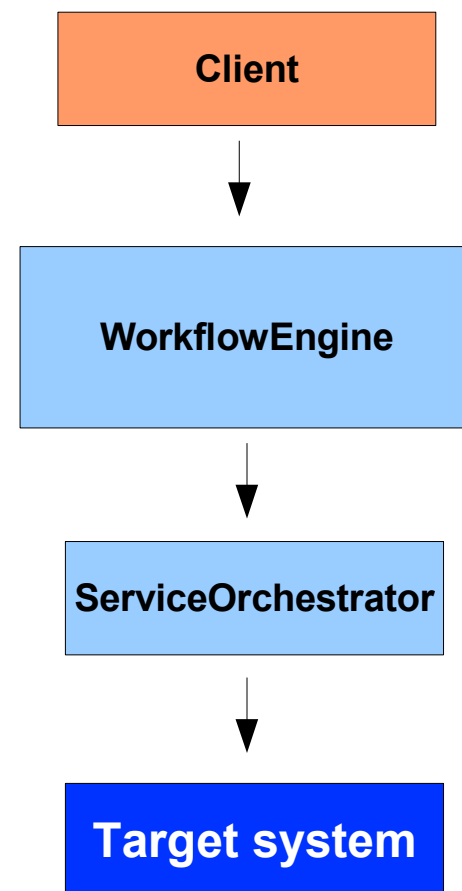

- Scalability and performance
 - Many target systems, applications parallelisable
- Support for domain-specific workflow languages
- Clear architecture
 - Separate process description and enactment
 - Keep workflow engine free of infrastructural concerns (e.g. guaranteed job execution)

Workflow system: details

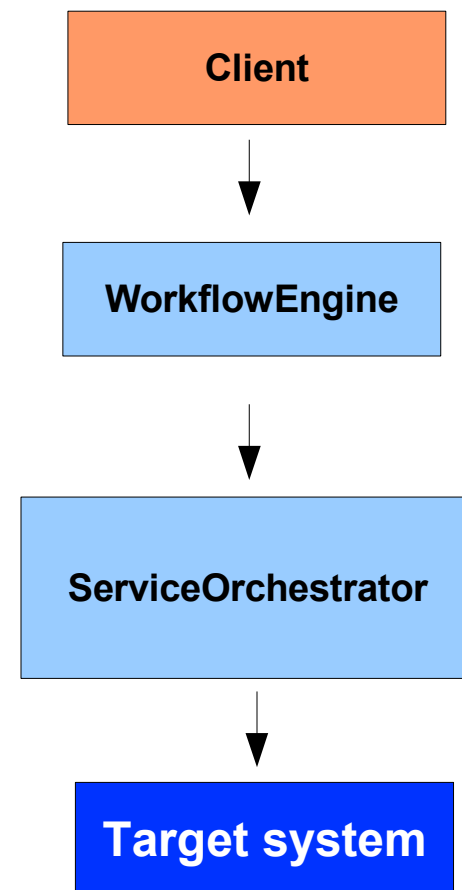

Workflow engine

- Supports domain-specific workflows
 - Used by clients
 - Pluggable
- Internal process description
 - XPD L 1.0 industry standard
- Constructs „atomic“ units of work
 - „Work assignments“
 - Not bound to target systems
 - Use „logical names“ for files

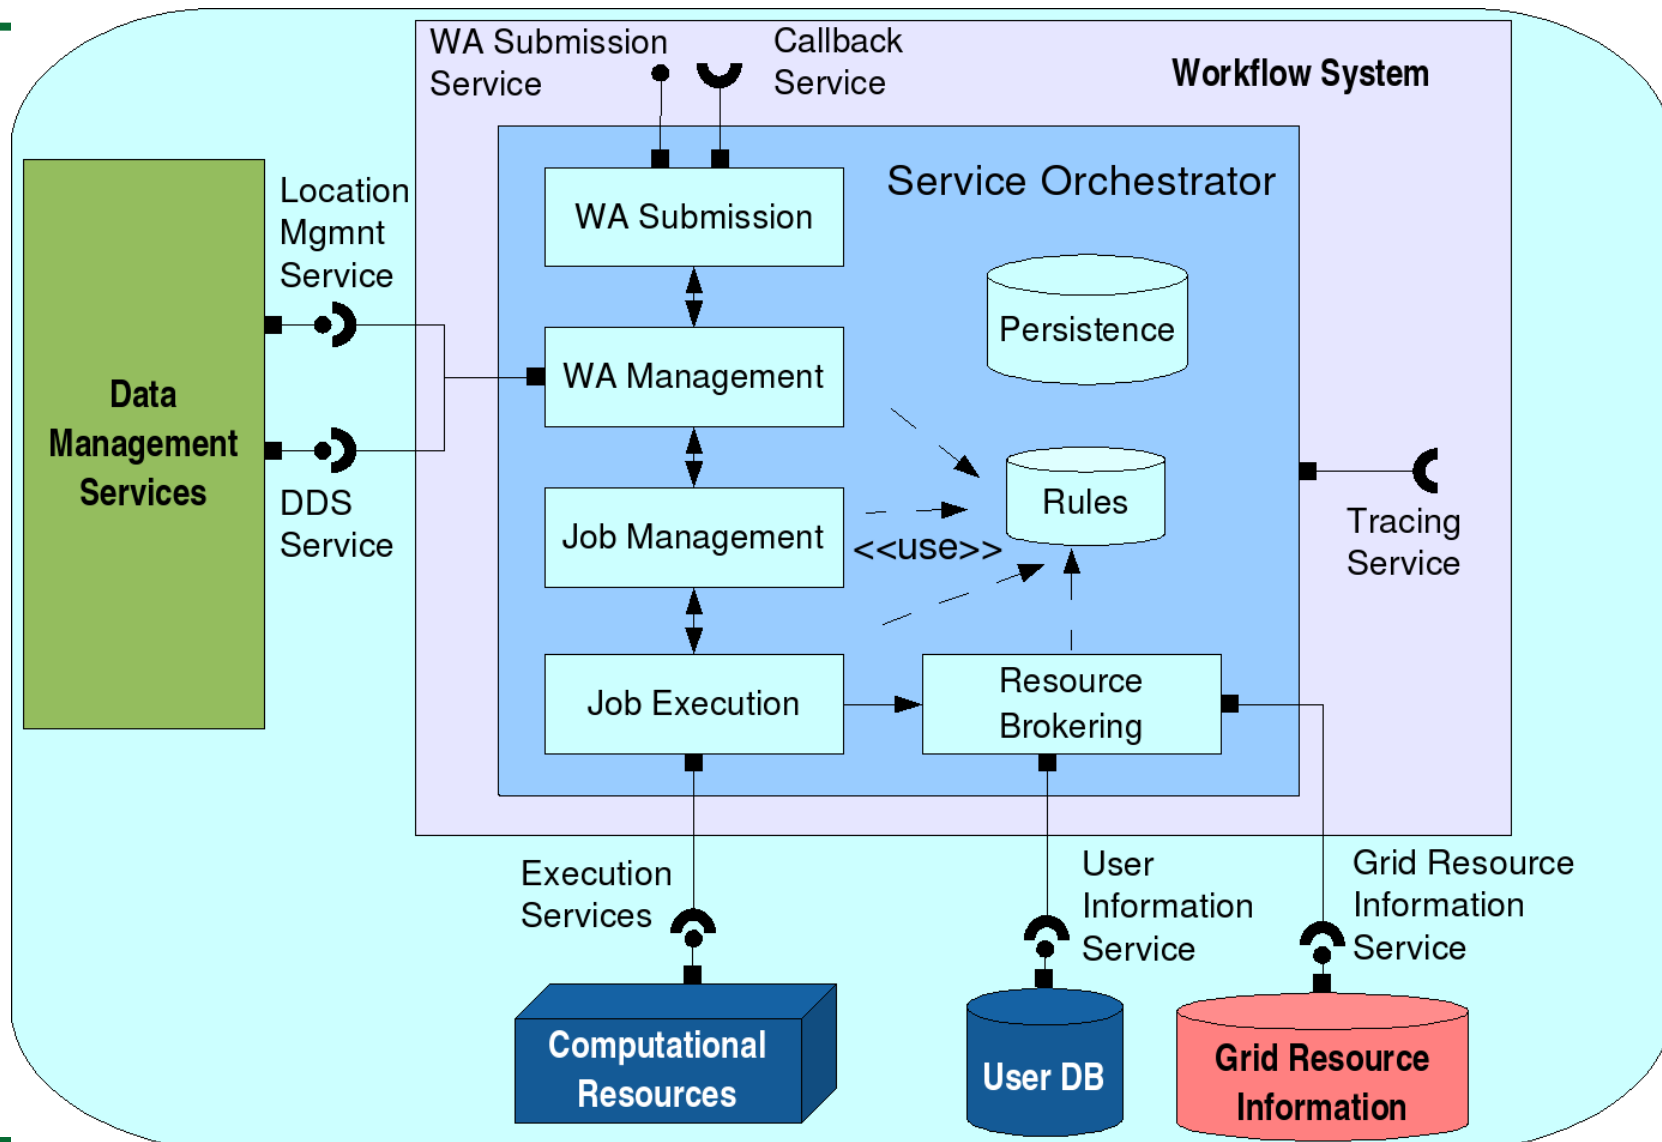

Service Orchestrator

- Execute atomic units of work (work assignments)
- Select and assign resources
- Resolve logical filenames to physical locations
- Store results to permanent storage

Service Orchestrator

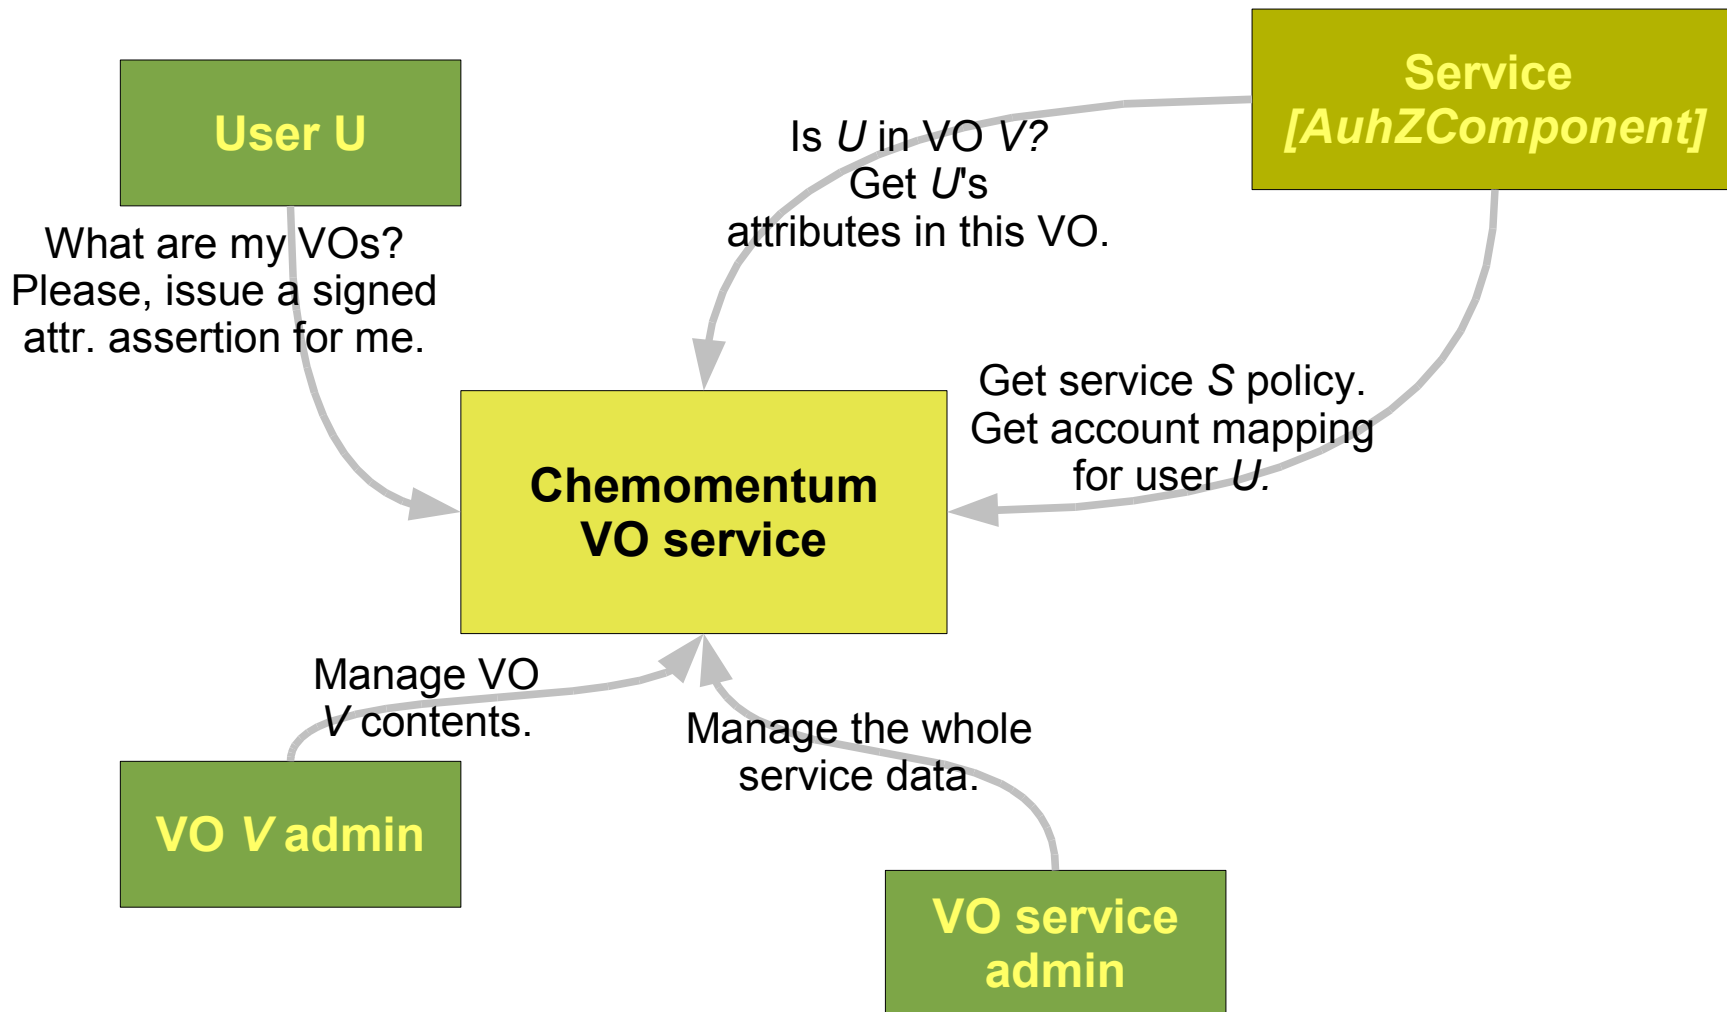

Service Orchestrator: Brokering

- Brokering:
 - Use live, dynamic information (where available)
 - System load
 - Job turnaround times (collected by the SO)
 - Static information
 - Installed applications, user rights, ...
- Grid Information Service
 - stores data relevant for brokering
- Brokering strategies are configurable (round robin, least turnaround time, ...)

VO service: goals

- Serve as Attribute and Policy Information Point, to support authorization process,
- Support authentication and new style (UNICORE 6) trust delegation by acting as identity format mapper,
- Provide flexible VO service access policy, to allow for distributed, multidomain management and usage of VO service's contents.

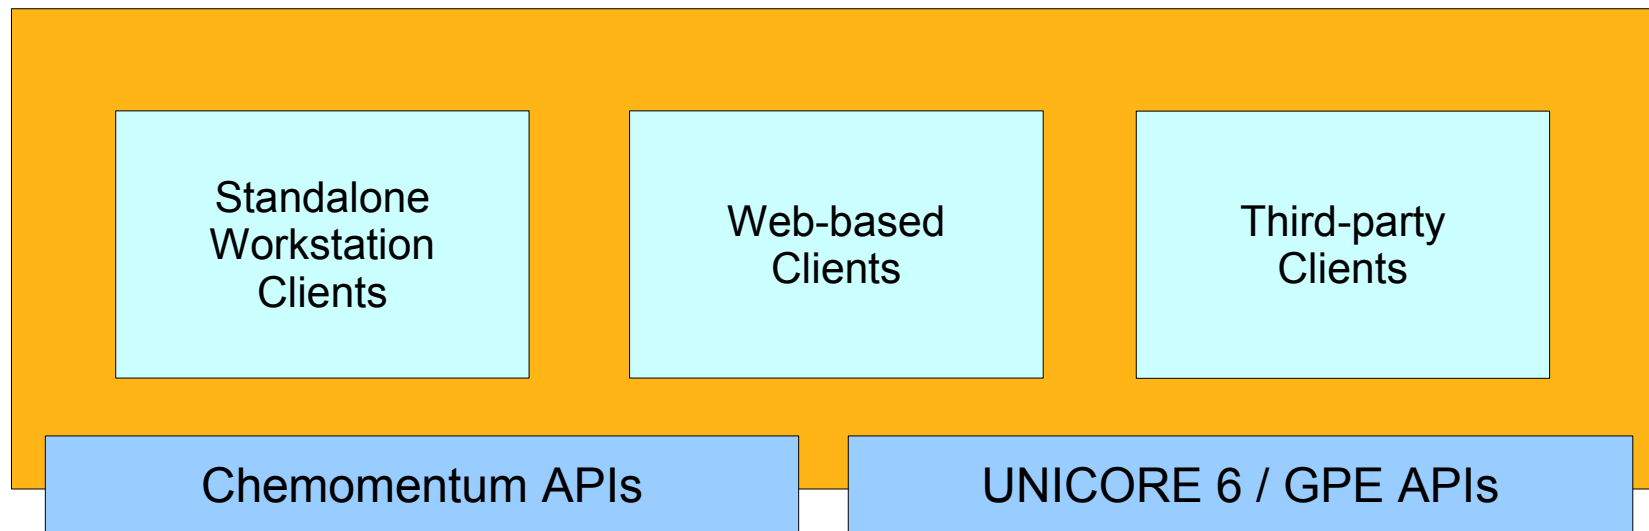

Use cases

VO service highlights

- SAML v2 protocol is used as interface for all query operations relevant from VO service contents consumer point of view
- Different formats of identities fully supported (i.e. with parsing/validation): X509 certificates and chains, DN, email&password
- Pure Java, possibility to deploy without *any* extra software (using embedded DB)
- Support for querying the *full* VO service history
- Can be used as a drop-in replacement for the UNICORE 6 XUADB

Client layer

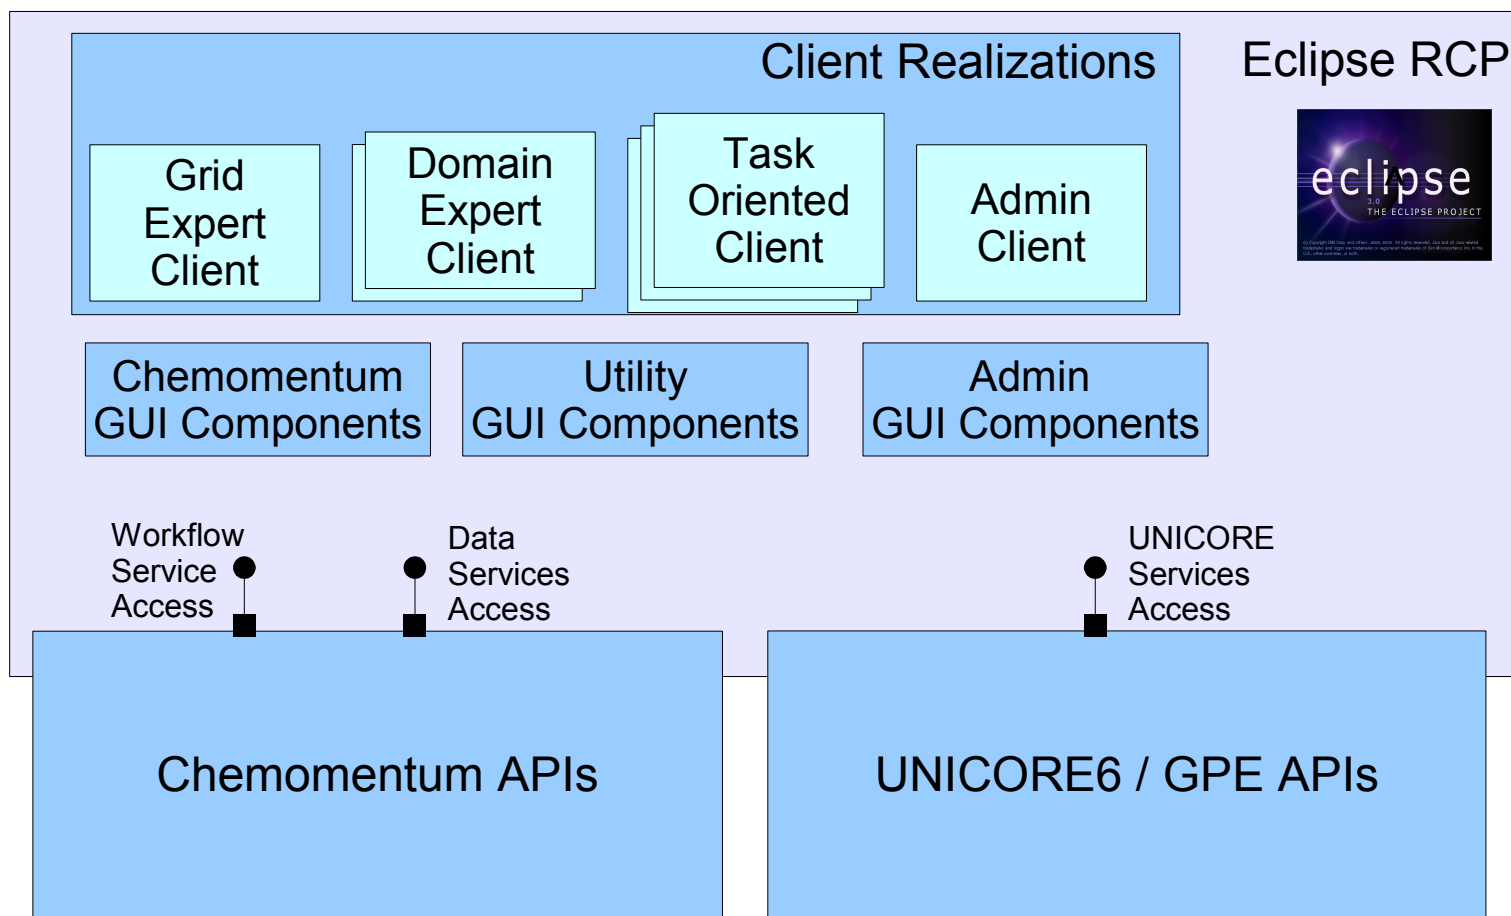

- Two main tracks
 - Standalone workstation clients
 - Web-based clients
- Side result: Grid-enabling third-party applications

Client layer: Goals

- Support standard UNICORE 6 application interfaces (GridBeans)
- Support different client configurations for different user groups (expert users, novice users)
- Easy-to-use, state of the art software

Workstation clients: Approach

Software: Client framework

- Started close collaboration with Intel on evolving GPE / GridBeans towards Eclipse-based framework
 - UNCORE 6.1
- Many GUI components are already available
- Work in progress
 - Workflow editor based on Eclipse GEF

Summary and outlook

- Chemomomentum
 - UNICORE 6 based system for complex applications in science and technology
 - Workflow system (DSLs, 2-tiered architecture, flexible brokering system)
 - VO management
 - Eclipse based client framework
- First software release is due Sept. 7

Thank you!
